

# TISSUE SEPARATOR ASSEMBLY AND METHOD

## ABSTRACT OF THE DISCLOSURE

5 [0037] A tissue separator assembly includes a proximal end assembly, typically a handle, and  
a catheter assembly, including a shaft and a tissue separator movable between a retracted state  
and an outwardly extending, operational state. An energy source may be selectively coupled to  
the tissue separator element. The tissue separator element may be moved to the operational state  
and then automatically rotated to separate a tissue section from the surrounding tissue. A tissue  
10 holding element may be used to help secure a separated tissue section to the catheter assembly.  
A tubular braided element may be used to surround the tissue separator element and any  
separated tissue section.
